An example *Geophysics* article, with a two-line title

*Joe Dellinger* and *Sergey Fomel*

ABSTRACT

This is an example of using geophysics.cls for writing *Geophysics* papers.

INTRODUCTION

This is an introduction. \LaTeX{} is a powerful document typesetting system (Lamport, 1994). An excellent reference is (Kopka and Daly, 2004). The new geophysics.cls class complies with the \LaTeX{}2e standard.

THEORY

This is another section.

Equations

Section headings should be capitalized. Subsection headings should only have the first letter of the first word capitalized.

Here are examples of equations involving vectors and tensors:

\[
\mathbf{R} = \begin{pmatrix} R_{XX} & R_{XY} \\ R_{XY} & R_{YY} \end{pmatrix} = \mathbf{P}_{M\rightarrow R} \mathbf{D} \mathbf{P}_{S\rightarrow M} \mathbf{S},
\]

and

\[
R_{j,m}(\omega) = \sum_{n=1}^{N} P_{j}^{(n)}(x_R) D^{(n)}(\omega) P_{m}^{(n)}(x_S).
\]

Note that the macro for the \texttt{tensor} command has been changed to force tensors to be bold uppercase, in compliance with current SEG submission standards. This is so that documents typeset to the old standards will print out according to the new ones: e.g., tensor \texttt{T} (note converted to uppercase).

Figures

Figure 1 shows what it is about.
Dellinger & Fomel

Figure 1: This figure is specified in the document by \plot{waves}{width=\textwidth}{This caption.}.

**Multiplot**

Sometimes it is convenient to put two or more figures from different files in an array (see Figure 2). Individual plots are Figures 2a and 2b.

The first argument of the `multiplot` command specifies the number of plots per row.

**Tables**

The discussion is summarized in Table 1.

**ACKNOWLEDGMENTS**

I wish to thank Ivan Pšenčík and Frédéric Billette for having names with non-English letters in them. I wish to thank Červený (2000) for providing an example of how to make a bib file that includes an author whose name begins with a non-English character and Forgues (1996) for providing both an example of referencing a Ph.D. thesis and yet more non-English characters.

**APPENDIX A**

**APPENDIX EXAMPLE**

According to the new SEG standard, appendices come before references.

*Example*
Figure 2: This figure is specified in the document by \multiplot{2}{exph,exgr}{width=0.4\textwidth}{This caption.}.

<table>
<thead>
<tr>
<th>Table Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>migration</td>
</tr>
<tr>
<td>zero-offset diffraction</td>
</tr>
<tr>
<td>DMO+NMO</td>
</tr>
<tr>
<td>radial DMO</td>
</tr>
<tr>
<td>radial NMO</td>
</tr>
</tbody>
</table>

Table 1: This table is specified in the document by \tabl{example}{This caption.}{...}.
\[
\frac{\partial U}{\partial z} = \left\{ \sqrt{\frac{1}{v^2} - \left[ \frac{\partial t}{\partial g} \right]^2} + \sqrt{\frac{1}{v^2} - \left[ \frac{\partial t}{\partial s} \right]^2} \right\} \frac{\partial U}{\partial t} \tag{A-1}
\]

It is important to get equation A-1 right. See also Appendix B.

**APPENDIX B**

**ANOTHER APPENDIX**

\[
\frac{\partial U}{\partial z} = \left\{ \sqrt{\frac{1}{v^2} - \left[ \frac{\partial t}{\partial g} \right]^2} + \sqrt{\frac{1}{v^2} - \left[ \frac{\partial t}{\partial s} \right]^2} \right\} \frac{\partial U}{\partial t} \tag{B-1}
\]

Too lazy to type a different equation but note the numeration.

The error comparison is provided in Figure B-1.

![Figure B-1](image)

Figure B-1: This figure is specified in the document by `\sideplot{errgrp}{width=0.8\textwidth}{This caption.}`.

**APPENDIX C**

**THE SOURCE OF THIS DOCUMENT**

```latex
\documentclass[paper]{geophysics}
\documentclass[manuscript,revised]{geophysics}

% An example of defining macros
\newcommand{\rs}[1]{\mathstrut\mbox{\scriptsize\rm #1}}
\newcommand{\rr}[1]{\mbox{\rm #1}}

\begin{document}
\title{An example \textit{Geophysics} article, \ with a two-line title}
\renewcommand{\thefootnote}{\fnsymbol{footnote}}
\ms{GEO-Example} % manuscript number

Example
```

Example
This is an example of using \textsf{geophysics.cls} for writing \textit{Geophysics} papers.

This is an introduction. \LaTeX{} is a \texttt{new} document typesetting system \cite{lamport}. An excellent reference is \cite{kopka}. The new \texttt{geophysics.cls} class complies with the \LaTeX{} standard. \texttt{old}We had something else written here but decided to get rid of it.\texttt{old}

This is another section.

Section headings should be capitalized. Subsection headings should only have the first letter of the first word capitalized.

Here are examples of equations involving vectors and tensors:

\begin{equation}
\begin{pmatrix}
R_{XX} & R_{XY} \\
R_{XY} & R_{YY}
\end{pmatrix}
= P_{M\rightarrow R} \; D \; P_{S\rightarrow M} \; S
\label{SVD}
\end{equation}
Example
\begin{tabular}{|c|c|c|}
\hline
\multicolumn{3}{|c|}{Table Example} \\
\hline
migration \rightarrow k_z$ & $\omega \rightarrow k_z^2$ & $k_y^2 + k_z^2 \cos^2 \psi = 4 \omega^2 / v^2$ \\
\hline
$\parbox{1in}{zero-offset\diffraction}$ & $k_z \rightarrow \omega_0$ & $k_y^2 + k_z^2 = 4 \omega_0^2 / v^2$ \\
\hline
DMO+NMO \rightarrow \omega_0$ & $\frac{1}{4} v^2 k_y^2 \sin^2 \psi + \omega_0^2 \cos^2 \psi = \omega^2$ \\
\hline
radial DMO \rightarrow \omega$s & $\omega \rightarrow \omega_s$ & $\omega_0 \cos \psi = \omega_s$ \\
\hline
radial NMO \rightarrow \omega_0$ & $\omega_s \rightarrow \omega_0$ & $\omega_0 \cos \psi = \omega_s$ \\
\hline
\end{tabular}

\begin{equation}
\frac{\partial U}{\partial z} = \left\{ \sqrt{\frac{1}{v^2} - \left[ \frac{\partial t}{\partial g} \right]^2} + \sqrt{\frac{1}{v^2} - \left[ \frac{\partial t}{\partial s} \right]^2} \right\} \frac{\partial U}{\partial t}
\end{equation}

Example
It is important to get equation~\ref{eqn:partial} right. See also Appendix~\ref{equations}.

\begin{equation}
\frac{\partial U}{\partial z} = \left\{ \sqrt{\frac{1}{v^2} - \left[\frac{\partial t}{\partial g}\right]^2} + \sqrt{\frac{1}{v^2} - \left[\frac{\partial t}{\partial s}\right]^2} \right\} \frac{\partial U}{\partial t} \label{eqn:partial2} \end{equation}

Too lazy to type a different equation but note the numeration.

The error comparison is provided in Figure~\ref{fig:errgrp}.

\begin{sidewaysfigure}
\centering
\includegraphics[width=0.8\textwidth]{errgrp}
\caption{This figure is specified in the document by $\backslash$sideplot\{errgrp\}\{width=0.8\backslash text\width\}\{This caption.\}.}
\end{sidewaysfigure}
